### Chapter 1

# Getting Started with Model Predictive Control

#### 1.1 Brief Review

In this section, we just consider state space linear time invariant system with zero steady state.

**Lemma 1.3** (LQR convergence). For (A, B) controllable, the infinite LQR gives a convergent closed-loop system.

*Proof.* Because (A, B) is controllable, there exists a sequence of n inputs that transfers the state to zero. When k > n, we let u = 0, then the objective function  $V(x, u) = \sum_{k=0}^{\infty} x_k^{\top} Q x_k + u^{\top} R u$  is finite, which implies the optimization problem is feasible. On the other hand, the solution is unique since R > 0 and the objective function is strict convex with u.

So the solution of the LQR problem exists and is unique. This implies to that the objective funtion is non-increasing with time, and we have  $x \to 0$ ,  $u \to 0$  as  $k \to 0$ .

**Remark.** The optimal solution can be calculate from Riccati equation, which is from backward dynamic programming similar to Kalman filter.

$$K = -(B^{\top}PB + R)^{-1}B^{\top}PA$$
  
$$P = Q + A^{\top}PA - A^{\top}PB(B^{\top}PB + R)^{-1}B^{\top}PA$$

### 1.2 The Solution of Exercises

**Exercise 1.1.** State space form for chemaical reaction model. In this exercise
